by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIII has been shown to contains a TBP and other TAFs. Purification of IFIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD. Serum raised against the TFIID fraction allowed cloning of the correspector lambda-gtll expression libraries.

(TAR) polypeptide, dTAFI140 (mol. weight 40kD). TAF peptides derived from dTAFI130 alpha, dTAFI130 beta, dTAFI140, dTAFI160, dTAFI130 beta, dTAFI140, dTAFI160, dTAFI180.

dTAFI1110, dTAFI1150, and dTAFI1250, their human equivalents and nucleic acids encoding them, are used to modulate transcription, initiation. TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator,

Surface molecule 4F2. Antisense DNA or RNA, antibodies, antibody fragments, and peptide and non-peptide antagonists to LAT1 are useful as anticancer agents. The present sequence encodes human LAT1, which is specifically claimed in the present invention.

They are used in the development of specific biochemical assays for screening compounds that agonise or antagonise selected transcription factors involved in regulating gene expression associated with human pathology.

                                                                                                                                                           This is the nucleotide sequence encoding the Drosophila TATA-binding protein (TBP) associated factor (TAF) designated TAFI160. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol. wt. of 60 kD by SDS-PAGE.

The invention relates to purified proteins involved in transcription

The present invention describes a cell surface protein which is an L-type amino acid transporter-1 (LAT1), which mediates the transport of neutral amino acids, leucine, isoleucine, propylalamine, methionine, tyrosine, tryptophan, value and histidine, into the cell independently of sodium ions. The LAT1 protein conjugates with the cell membrane
                                                                             Human L-type amino acid transporter 1 nucleotide sequence SEQ ID NO:1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Neutral amino acid transporter protein which conjugates with cell membrane protein 4F2 and operates independently of sodium ions is useful for screening potential cancer proliferation inhibitors -

A00010 to A02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of pre-metrastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polynucleotide library used to determine cancerous states of mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Labat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sudduth-Klinger J;

This cDNA sequence includes an open reading frame encoding rat islet-brain 1 (IBI, see W80601), a transcriptional activator that is involved in the control of the GIUT2 and insulin genes by interacting with homologous cis-regulatory elements of the GLUT2 and insulin gene promoters. IBI cDNA was isolated from a rat of interacting with homologous cis-regulatory elements of the GLUT2 cand insulinoma INS-1 CDNA using GTI1 oligonucleotides conferentiated insulinoma INS-1 CDNA using GTI1 oligonucleotides capon of the GLUT2 promoter. IBI is abundantly expressed in the region of the GLUT2 promoter. IBI is abundantly expressed in the caporcatic islets in the brain. Human IBI polymotleotide (see W80602) and polypeptide (see W80602) are also claimed. IBI polymotleotide (see W80602) are also claimed. IBI colympaptides, nucleic acids, agonists and antagonists can be used in the treatment or diagnosis of diabetes, neuromal disabilities or cancers, to inhibit cells from undergoing apoptosis, to treat dementia, parkinsonism, Alzhelmer's disease, neuronal disabilities such as speech disorders and memory alteration, autoimmume diseases
                                                                                                                                                                              IBI; islet-brain 1; transcription factor; rat; diabetes; dementia; Parkinson's disease; Alzheimer's disease; epilepsy; neuroblastoma; glioblastoma; apoptosis; cancer; autoimmune disease; systemic lupus erythematosus; myocardial infarction; ischaemia; diagnosis; therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated transcription factor islet-brain 1 - used to develop products for treating e.g. diabetes, neurodegenerative disorders, cancers, autoimmune disease, heart disease or epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    to develop

Sequences V69704 to V69715 represent introns of the gene encoding an equilibrative nucleoside transport protein (iENTP), which is insensitive to introbenzylmercaptopurine riboside (NBMFR). Cells transformed with a construct containing the iENTP nucleic acid can be used to produce the protein recombinantly. IENTP is used to identify specific ligands (protein recombinantly. IENTP is used to identify specific ligands constructly antiviral and antitumour nucleoside analogues that are preferentially provides all available transport activity are used. Contain provides all available transport activity are used, as to identify permeants of iENTP and (b) to screen specific inhibitors of identify permeants of iENTP and (b) to screen specific inhibitors of is identify permeants of iENTP and (b) to screen specific inhibitors of as probes, primers, antisense molecules, and ribozymes for therapy or diagnosis, and knockout mice in which both alleles encoding iENTP contain an inactivating defect are also useful for drug screening. Contain an inactivating defect are also useful for drug screening. Contain an inactivating defect are also useful for drug screening. Contain an inactivating defect are also useful for drug screening. Contain an inactivating defect are also useful for drug screening. Contain an inactivating defect are also useful for drug screening. Contain an inactivating defect are also useful for drug screening. Contain an inactivating defect are also useful for drug accenting that land and the inactivation of the inactivat

This invention describes novel polypeptide fragment sequences (I) and their encoding nucleic acids (II) which are highly expressed in normal bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for the treatment of bladder tumours, to directly treat this form of cancer (including expression from gene of therapy vectors), or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling ESTS (expressed sequence tags) from a particular cusume type before comparison of expression patterns. This allows a caduces the number of fallures because of ESTS from different libraries representing different parts of the same unknown gene distorting the estimated frequency of occurrence in a particular tissue. 24112-242248 crepresent EST fragments derived from a human normal bladder tissue cDNA xx
                                                                                                                                                                                                                                                                                                                                                                                             <u>:</u>

                                                                                                                                                                                                                                                                                                                                                           alleles encoding lEMP contain an inactivating defect are also useful for drug screening. Cells that have been transduced with lEMP nucleic acid acry vivo are used particularly, for cancer chemotherapy. Vectors in which the lEMTP gene is linked to a heterologous gene (e.g. encoding adenosine deaminase and factor VIII) can be used for gene therapy.
                                                                                                                                                                                                 encodes an equilibrative nucleoside transport procein (IENTP), which is insensitive to nitrobertylmercaptopurine riboside (NBMPR), Cells transformed with a construct containing the IENTP nucleic acid can be used to produce the protein recombinantly. IENTP is used to identify specific ligands (particularly antiviral and antitumour nucleoside anialogues that are preferentially transported into cells) and to raise activity are used: (a) to identify permeants of IENTP and (b) to screen specific inhibitors of iENTP (potential drugs) Fragments of the iENTP nucleic acid are used, as probes, primers, antisense molecules, and ribosymes for therapy or dlagnosis, and knockout mice in which both

The present sequence is the cDNA encoding human cyclic nucleotide associated protein-2 (CNAP-2), identified in Incyte clone 3149674, that is isolated from ADRENONO4 CDNA library. It is expressed in nervous, reproductive, cardiovascular and haematopoietic/immune tissues. CNAP sequences may be used for prevention, treatment and diagnosis of diseases associated with altered CNAP expression such as, call proliferative disorders (e.g. arteriosclerosis, cirrhosis, leukaemia, lymphoma and cancer of the breast, prostate, lung and brain), autoimmune/ inflammatory disorders (e.g. asthma, anaemia, diabetes mellitus, multiple sclerosis and psoriasis), neurological disorders (e.g. epilepsy, alzheiner's/Parkinson's disease and strokes), vision disorders (e.g. conjunctivitis, glaucoma, cataracts and retinitis pigmentosa), creproductive disorders (e.g. infertility, uterine fibroids, ectopic pregnancies and impotence) and smooth muscle disorders (e.g. anaphylactic shock, Kearns-Sayre syndrome and hypertension). It can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1185 ctccgacttcgacatggcctatgagcgtggccggatctccgtgtccctgcaggaaggc 1244

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a human expressed sequence tag (EST). The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, haematopolesis regulating chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/chemothactic/ch

                                                                                                                                                                                                                                                                                                                                                                                                                                          Fchd605 is a novel human gene that is up-regulated in monocytes treated with oxidised low density lipoproteins (LDL). Differential display was used to detect genes that are differentially expressed in monocytes treated so as to simulate the conditions under which foam cells develop during atherogenesis. Both fchd605 and fchd602 (see T94470) are up-regulated under the disease condition of treatment with oxidised LDL. The fchd605 gene product (see W16006) has sequence similarity to mouse gly96. The discovery of the up-regulation of these 2 genes provides a fingerprint profile, e.g. markers for the study of cardiovascular diseases, including atherosclerosis, ischemial/repertusion, hypertension, restenosis and arterial inflammation. Methods are provided for the diagnosis,

cardiovascular diseases by novel human genes which are differentially expressed in different cardiovascular disease states. Compositions which can modify TGF-beta signalling pathway are identified by screening. These are used therapeutically to treat fibroproliferative and oncogenic disorders, especially TGF (Transforming growth factor)-beta related disorders, including diabetic retinopathy, artherosclerosis, pancreatic cancer, angiogenesis, inflammation, fibrosis, tumour growth and vascularisation. The present sequence is fch6605 gene which is upregulated in monocytes treated with oxidised LDL (low density lipoprotein) can be used to design cardiovascular disease treatment strategies. Depending on whether the up-regulation has a pathogenic or decrease the activity of the protein product of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying substances for ameliorating symptoms of fibroproliferative diseases or oncogenic related disorders -

NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of 11.M.A.G.E. clones 297480-302087, 682632-687239, 72408-728711, and 729096-731399.
